                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in separate lanes.                                                                                     AAQ75727
                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAO75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

The method can be used to analyse gene expression rapidly and easily

The nucleotide changes in each CC (NGT1) gene sequence polymorphisms. The nucleotide changes in each CC polymorphism are numbered from the A of the first methionine for the exon CC in which the polymorphism occurs. The UGTs are a family of enzymes that CC catalyse the glucuronic acid conjugation of a wide range of endogenous and exogenous substrates including phenols, alcohols, amines and fatty CC acids. Many of the reactions catalysed by UGTs result in toxic substances CC being converted to compounds which are more water soluble and are CC excreted. The polymorphisms sequences are useful as probes for detecting CC UGT1 locus polymorphisms, indicative of altered UGT1 expression or CC activity. These polymorphisms are associated with Crigler-Najjar and CC Gilbert syndromes (unconjugated hyperbilirubinaemia) and drug metabolism CC of UGT1 substrates, possible drug-drug interactions and adverse side CC ffects (i.e. to optimize drug dosage), and to streen for diseases caused CC by exposure to toxins and to strudy the effects of polymorphisms on CC enzymatic activity. The UGT1 sequences, including polymorphisms or to generate transgenic animals or modified cells e.g. for pharmacogenetic CC errenting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Creading out, where the nucleic acids are selectively bound using capture comprise variable and non-variable regions. The capture oligonucleotides comprise variable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with straptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids (LNA) and the anchor region conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, chair root, blood, nerve or germ cells and (ii) for determining the cativity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and captures imaging of the complete pattern of all nucleic acids in a cell, and can detect very small differences in pools of nucleic acids from cells. It can detect very small differences in the nucleic acid grom cells. It can detect very small differences in the nucleic acid store the comparison of nucleic acid pools, not individual compound is based on comparison of nucleic acid pools, not individual capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Comprise variable and non-variable regions. The capture oligonactorides contribute variable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids. The capture capture oligonated to the surface is (quasi) covalent, supramolecular, cylass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, cylass, complements and electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the captures. The method provides rapid, inexpensive and reproductible representation of differences in pools of nucleic acids from cells and captures inaging of the complete pattern of all nucleic acid in a cell, and centure is based on comparison of nucleic acid pools. Since the capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁

CC comprise variable and non-variable regions. The capture oilgonucleotides CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture capture oilgonucleotides are biotinylated and immobilised on a surface by cc capture oilgonucleotides are biotinylated and immobilised on a surface by cc capture oilgonucleotides are biotinylated and immobilised on a surface by cc capture oilgonucleotides are biotinylated and immobilised on a surface by cc capture oilgonucleotides are biotinylated and immobilised on a surface by cc capture oilgonucleotides are biotinylated and immobilised on a surface by cc capture oilgonucleotides are biotinylated and immobilised on a surface by cc capture oilgonucleotides are biotinylated and immobilised on a surface by cc granded nucleic acids to the surface is (quasi)covalent, lts surface cc stranded nucleic acids to the surface is (quasi)covalent, baving semi-cc physical, stimulated by an electrical field or through a molecular, cp physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, carids to the surface ells and (ii) for determining the captures. The method provides rapid, inexpensive and reproducible and captures. The method provides rapid, inexpensive and reproducible is allows imaging of the complete pattern of all nucleic acid scid in a cell, and capture probasic capture probasive and reproducible is allows imaging of the complete pattern of all nucleic acid pool. Since the method of the nucleic acid pool. Since the capture probasic under the method of the hovention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example; Page 4; Spp; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2003-714082/68
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            constant regions.
                                                        probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        n describes a novel method for sorting single-stranded by isolation and hybridisation of nucleic acid pools, then

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC comprise variable and non-variable regions. The capture originic rectives a first variable anchor region, the complement of which is present at that comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly 15-25, T residues. The capture capture oligonucleotides are bottinylated and immobilised on a surface by interaction with streptavidin. The material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface by transded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (1) for analysis of patterns, especially in mucosal, thair root, blood, nerve or germ cells and (1) for determining the cacids (amino, carboxylic or fatty acid) or their derivatives, sales and captures. The method provides rapid, inexpensive and reproducible caids (amino, carboxylic or fatty acid) or their derivatives, sales and captures. The method provides rapid, inexpensive and reproducible. It captures. The method provides rapid, inexpensive and reproducible. It captures are selective pattern of all nucleic acid in a cell, and capture representation of differences in the nucleic acid pool. Since the capture received in the method is possible. ApX01281-ApX01344 represent captures received in the backbod of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The capture is the formula of the surface of a solid matrix and (b) comprise variable and non-variable regions.

                                                                                                                                                                                                      CC surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating CC expression of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition CC of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a CC treating a respiratory, lung or malignant disease. The administered CC composition comprises oligo and is administered to reduce the production CC or availability, or to increase the degradation of the target mRNA or to CC reduce the amount of target polypeptide present in the lungs. The CC ulmonary obstruction, and/or buronchoconstriction and/or lung CC with a disease or condition such as pulmonary vasoconstriction are associated confilammation, allergies and/or surfactant hypoproduction are associated confilammation, allergies and/or surfactant managed respiratory resories and resories 
                                                                                                                       Query Match

                                                                                                    Matches
                                                                                                                                                                                                                                                inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allers reducing adenosine sensitivity, levels of adenosine (A) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, target nucleic acids associated with lung airway or lung dysfunction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WO200285309-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo sapiens.

(I) and the polynucleotide encoding it can be used for treating various diseases, such as malignant tumour, inflammations, development disorder, immunological diseases, haemopathy and HIV infection. The present sequence represents a PCR primer for (I), which used in an example from the present invention

(I) and the polynucleotide encoding it (II) have cytostatic, virucidal, immunomodulatory, antiinflammatory and haemostatic, and can be used in gene therapy and vaccine production. (I) and (II) can be used in the diagnosis and treatment of cancer, haemostatly, HIV infection, immunological diseases and various inflammations. The present sequence represents a PCR primer for human RNA helicase 15, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human RNA helicase 15 and encoded polynucleotide, applicable in diagnosis and treatment of malignant tumor, hemopathy, HIV infection, immunological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mao
                                                     The present invention provides the protein and coding sequences of human phosphatidylinositol-3 (PTDINS-3) kinase 35. The sequences can be used in the treatment of cancer, haemopathy, HIV infection, development disorders, immunological diseases and inflammation. The present sequence
                                                                                                                                                                                                                                                                   New human phosphatidylinositol-3 (PTDINS3) kinase 35 for diagnosing treating malignant tumor, hemopathy, human immunodeficiency virus
                                                                                                                                                                                                                                                                                                                                                       WPI; 2002-025836/03
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-MAR-2001; 2001WO-CN000328
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          11-OCT-2001.

                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                  The present invention relates to the isolation of polypeptide-laminin B210.67, and the polynucleotide encoding it. Also described is the process for preparing the protein by DNA recombination. The polypeptide is useful for treating diseases such as embryo development teratogenesis. The present sequence for reverse transcriptase (RT).PCR primer #1 is used with RT-PCR primer #2 (ABK12410) for isolating cDNA encoding polypeptide-laminin B210.67
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
 Oligo dT primer #2 used in method to study gene expression.

                                                                               Matches
                                                                                                                                                                                                                   compositions and systems that incorporate new strategies where molecular or biochemical assay compositions and systems are linked to DNA or RNA sequence databases for optimal resource efficiency in assaying gene expression. The system has the following advantages over existing methods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence information in addition to information concerning changes or differences in mRNA level, to determine mRNA expression level and mRNA identification in one assay; (c) generates cDNA fragments from all mRNAs present in the sample for subsequent investigation by common molecular biology techniques; and (d) does not require prior knowledge of the sequence of the organism under investigation and can be employed in organisms lacking significant genomic sequence in formation. The present sequence represents an oligo dT primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to systems to interest to invention relates to system in the invention relates to system in the identimer having a specific oligo-dT primer sequence, where the identimer comprises a specific oligo-dT primer sequence, where the identimer comprises a detectable marker at its 5' end. The system is useful for identifying any or all genes expressed in a given in vivo or in vitro RNA sample, as well as the relative differences in mRNA between 2 or more samples, where desired, for supporting discovery of new genes, and for identifying mRNAs that are expressed at different levels between 2 or more samples. The new system or method addresses limitations of prior methods by comprising commonsitions and systems that incorporate new strategies where molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 11; 45pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying and characterizing gene expression in samples, identifying mRNAs expressed at different levels, comprises identimer having a oligo-dT primer of a specific sequence a detectable marker at its 5' end.

CC or all genes expressed in a given in vivo or in vitro RNA sample, as well contained the relative differences in mRNA between 2 or more samples, where CC desired, for supporting discovery of new genes, and for identifying mRNAs CC that are expressed at different levels between 2 or more samples. The new system or method addresses limitations of prior methods by comprising CC compositions and systems that incorporate new strategies where molecular cor biochemical assay compositions and systems are linked to DNA or RNA CC sequence databases for optimal resource efficiency in assaying gene CC expression. The system has the following advantages over existing CC methods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence in formation in addition to information concerning changes or differences in one assay; (c) generates CDNA fragments from all mRNAs present in the centification or capanisms lacking significant genomic sequence in formation. The present construction is sequence represents an oligo dT primer used in the method of the present construction.

that recognises a target site on a DNA. The method comprises expressing thybrid nucleic acids with a test zinc finger domain in cells containing a comporter construct, where the reporter gene is expressed above a given construct when a transcription factor recognises a recruitment and a target site of a promoter, and not only the recruitment site of the promoter. The method is used to: (a) identify a zinc finger domain that recognises a target site on a promoter; (c) generate a nucleic acid that concept site on a promoter; (d) generate a nucleic acid that concept set on a promoter; (e) generate a nucleic acid that concept set on a promoter; (e) generate a nucleic acid that concept set on a promoter; (e) generate a nucleic acid that concept set on a promoter; (e) generate a nucleic acid that concept set on a promoter; (e) generate a nucleic acid that concept set on a promoter; (e) generate a nucleic acid that concept set on a particle on a p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a zinc finger domain for e.g. designing new polypeptides that bind to a specific site on a DNA, comprises expressing hybrid nucleic acids with a test zinc finger domain in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2001-557644/62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          17-FEB-2001; 2001WO-KR000244
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of identifying a zinc finger domain that recognises a target site on a DNA. The method comprises expressi

The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ256428.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC AAZ65654 to AAZ69578 represent human biallelic markers from the present CC invention, which contain a polymorphic base at position 24 of their CC nucleotide sequences. AAZ69579 to AAZ7740 represent amplification CC primers for the biallelic markers. The biallelic markers of the invention CC have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies CC which are useful in determining the genetic basis for disease states. CC compositions and methods of the invention can also be useful for the CC identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the CC differential efficacious responses to and side effects from CC N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and CC 3367, are not actually given a sequence in the Sequence Listing from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GPAT, and inhibits the expression of GPAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GPAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GPAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GPAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MOE wings and a deoxy gap, these oligonucleotides inhibit human GPAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid encoding (GFAT), for treating ischemia/reperfusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAT), for treating diabetes, a cardiovascular or neurologic disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 4; SEQ
                                                                                                            Identifying target genes for allele-specific drugs - used for diagnosis prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                               WPI; 1998-521232/44.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC potentially useful for treatment of cancer, where the inhibitor is active cn a gene vital for cell growth or viability, and where the gene is CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient having a CC precancerous condition, by administering to the patient a first allele creater in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor CC is active on at least one but less than all allelic forms of the gene creater in a population and targets only one allelic form present in the comman somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. CC lesions, benign tumours, endometriosis, polycystic kidney disease, and CC graft versus host disease. The method can also be used to remove complete the method can also be used to remove the method can also be used to remove complete the method of the invention control of the method of the invention control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                     A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GRNESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GRNESEQ files AQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
A method for the analysis of cDNA double-stranded cDNAs by using an

                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Analysis of cDNA and gene expression - by amplification by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1995-018287/03.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate (double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GBNESEQ filles AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate (double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAO75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

The invention provides isolated Toxoplasma gondii nucleic acids that encode immunogenic polypeptides. The T. gondii nucleic acid molecules, immunogenic proteins and antibodies to the proteins can be used to inhibit T. gondii occyst shedding in a cat due to infection with T. gondii. They can be used for preventing T. gondii infection and for preventing the spread of T. gondii infection. They can also be used for detecting T. gondii infection. They can also be used for preventing the spread of T. gondii infection method can be used to detect parasite cysts or occysts in feces, e.g. from enteric apicomplexa occysts such as Cryptosporidium occysts and Toxoplasma occysts. Sequences AAX91276-395 primers used in RT-PCR analysis of nucleic acid sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate (double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAO75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                           This invention describes novel purified aptameric oligonucleotides which have antimicrobial, cytostatic and immunosuppressive activity. The oligonucleotides are useful for binding to and preventing or inhibiting the biological function of a protein kinase or a target molecule and for detecting the presence or absence of a target molecule in biological samples. The oligonucleotides are also useful for prophylactic and therapeutic treatment of diseases such as cancer, autoimmune diseases and diseases caused by pathogenic microorganisms. This sequence represents a primer used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotides inhibiting protein kinase, useful for treating diseases such as cancer and autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antimicrobial; cytostatic; immunosuppressive; protein kinase; prophylactic; therapy; treatment; cancer; autoimmune disease; pathogenic microorganism; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to detection of parasite oocysts or cysts in a faeces sample comprising contracting the sample with a solid support, drying and then washing the sample with an aqueous wash solution, adding an aqueous elution solution and eluting DNA from the sample by heating and amplifying by PCR oocyst/cyst-specific DNA and detecting the amplification products. The method is useful for detecting parasite occysts e.g., enteric apicomplexa oocysts such as Cryptosporidium oocysts or Toxoplasma oocysts, or for detecting parasite cysts. The method is also useful for developing vaccines to prevent cysts. The method is also useful for developing vaccines to prevent occyte shedding in cats. The present sequence is a PCR primer used to isolate DNAs encoding immunogenic proteins from Toxoplasma gondii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oocyte shedding;

CC fragment of a nucleic acid encoding a putative microbial virulence factor for the identification of a disease caused by mutations or for a genetic CC predisposition. The invention also relates to a method for identification of a disease which comprises detecting the presence of a mutation within CC a nucleic acid sequence of the fragment of virulence factor in a tissue-or blood sample of a subject, where the tissue sample is a foetal graft CC (untranslated region) of the gene and mutation is inserted in the 3' UTR CC (untranslated region) of the gene and mutation is found in the CC polyadenylation signal of G1. The method is useful for identification of CC plyadenylation signal of G1. The method is useful for identification of CC parkinson's disease, schizophrenia, myopathy, other forms of dementias constitutes a predisposition or for their genetic predisposition where CC parkinson's disease, schizophrenia, myopathy, other forms of dementia, putation and where the human disease constitutes a predisposition or a genetic variation, they Body CC manifestation of which is triggered by medicaments or drugs which is preferably cannabis, where the manifestation comprises any forms of dementia, schizophrenia or related psychiatric disorders. The invention CC identifying or screening of compounds that have an effect on the CC identifying or screening of compounds that have an effect on the CC identifying or screening of compounds that have an effect on the CC identifying or screening of compounds that have an effect on the CC identifying or screening of protein of the translated protein (e.g. CB1 protein). The present sequence is plasmodium falciparum integral membrane protein on falciparum integral membrane components that have an effect on the content of the conten

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a replicase complex comprising a hepatitis C CC virus (HCV) NS5B replicase protein, a linear nucleic acid template and a complementary nucleic acid primer which is annealed to the 3' terminus of CC the template, where the template is at least three nucleotides and the primer is two or three nucleotides, and the template and primer do not CC form a stable duplex in solution in the absence of the HCV NS5B protein. CC The complex is useful for detecting HCV replicase activity and permits CC establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and CC efficacy of the inhibitors. The complex is also useful in the development CC of a reliable system for determining kinetic and thermodynamic constants of HCV NS5B-catalysed nucleotide incorporation and investigation of CC mechanistic inhibitors for mis-incorporation or chain termination. CC specifically, the short RNA template and primer pairs are useful in the corporation and mechanistic properties of NS5B replication and ultimately in the CC engulcase activity may be used for developing anti-HCV pharmaceuticals. CC Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel diagnostic kit for determining tolerance CC of pharmaceuticals in humans by determining allalic variability of at CC least two polymorphisms of a human enzyme involved in phase I and/or II CC of the detoxification mechanism in a blood, tissue or other human sample, where tolerance is determined from presence or absence of alleles. The CC kit comprises two pairs of oligonucleotide primers, in which each pair CC amplifies, by PCR, part of a gene for a human detoxification mechanism-CC associated enzyme. The kit may also contain two further pairs of CC oligonucleotides, serving as probes for detection of amplified DNA CC segments, especially where the probes are complementary to a single CC fluorophores (IC-Red640 or IC-Red705 for 5'-labelling or fluorescein for CC fluorophores (IC-Red640 or IC-Red705 for 5'-labelling or fluorescein for CC cry3A4, mEH, TPMT, WHIFR, paraoxonase, CYP209, CYP2C19, CYP2D6, CYP1A2, CC CYP3A4, mEH, TPMT, WHIFR, paraoxonase, CYP209, CYP2C19, CYP2D1 or DPD. CC cryd, to establish a suitable dose and/or to predict if a subject will considered the molecular level. This sequence represents a probe used in CC enzymes at the molecular level. This sequence represents a probe used in the kit of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The protein is useful for inhibit cocyst shedding by cats infected with Toxoplasma gondii. The protein is useful for preventing or ameliorating diseases caused by infection with T. gondii. The nucleic acid can be used as genetic vaccine which encodes the protein. The protein and the nucleic acid are used as diagnostic respects for detection of T. gondii infection. The present sequence is used in the exemplification of the
This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rat DNA microarray capture oligonucleotide #16

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Computer variable and non-variable action region, the complement of which is present at that comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow comprises are particular sorts of single stranded nucleic acids. The capture coigonucleotides are bottinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface coig particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, comprised, stimulated by an electrical field or through a molecular of physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, acids (anino, carboxylic or fatty acid) or their derivatives, e.g. food cadditives or supplements, especially minerals, trace elements, organic caids (anino, carboxylic or fatty acid) or their derivatives, salts and callows imaging of the complete pattern of all nucleic acids in a cell, and can detect very small differences in pools of nucleic acid in a cell, and can detect very small differences in the nucleic acid sold. Since the complete pattern of all nucleic acid in a cell, and capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cc binding of particular sorts of single stranded nucleic acids. The capture comprises as sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The cc capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single cranded nucleic acids to the surface is (quasi) covalent, supramelecular, cphysical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysts of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the cariotivity of pharmaceuticals and/or nutritional compounds, e.g. food cadditives or supplements, especially minerals, trace elements, organic caids (amino, carboxylic or fatty acid) or their derivatives, salts and caids (amino, carboxylic or fatty acid) or their derivatives, salts and caid method provides rapid, inexpensive and reproducible can detect very small differences in pools of nucleic acids from cells. It can detect very small differences in the nucleic acids from cells and companies of nucleic acid spols, not individual companies used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             á

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture
    Sorting single-stranded nucleic acid, useful for analyzing expression

patterns and screening active agents, uses capture agent with variable and constant regions.
```

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded conclusic acids by isolation and hybridisation of nucleic acid pools, then compared that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at clear tock in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorte of single stranded nucleic acids. The capture capture oligonucleotides are biotinvaled and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, computed is used (l) for analysis of patterns, especially in mucosal, that root, blood, nerve or germ cells and (i) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food acids (amino, carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid. Salts and reproducible carboxylic acid or the model acid pool since the method of the model aci capture probes used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc reading out, where the nucleic acids are selectively bound using capture capents that are (a) immobilised on the surface of a solid matrix and (b) cc comprise variable and non-variable regions. The capture oligonucleotides cc have a 5'-invariable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly 15-25. T residues. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface by interaction triples and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface is (quasi) covalent, supramolecular, for an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, caids (maino, carboxylic or fatty acid) or their derivatives, salts and caids (maino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible conductible and the based on comparison of nucleic acid pool. Since the conductive method is based on comparison of nucleic acid pool. Since the capture probes used in the method of the heartful pools, not individual conductions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Comprise variable and non-variable regions. The capture ollogouelectides to have a 5' invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow CC binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by CC interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, CC hair root, blood, nerve or germ cells and (ii) for determining the CC activity of pharmaceuticals and/or nutritional compounds, e.g. food acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, salts and carboxylic or fatty acid) or their derivatives, and cell, and carboxylic or fatty acid or nucleic acid pool. Since the method provides rapid, inexpensive and reproducible acid pools, not individual compensation in the mucleic acid pool. Since the carboxylic provides rapid, inspensive and reproducible acid pools, not individual genes, matrix microsers in the nucleic acid pool. Since the

The method is useful for detecting ligand binding to biological molecules. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detection of ligand binding to biological molecules comprises obtaining database comprising coordinates of disulfide-containing protein fragments, each fragment comprising disulfide-bonded cysteine and first
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;

The method of the invention may be used for identifying allosteric sites, for example in proteins such as enzymes, particularly caspases (cysteine aspartate-specific proteases). The current sequence is that of the PCR primer (SEQ ID 11) of the invention which was used to generate a human caspase-3 (Yama; CPP32 beta
The present invention relates to a device that has at least one surface that contacts tissue and/or liquids of the human or animal body and is a least partly coated with a substance that mediates binding of biological materials. The new feature is that this substance is an aptamer. The device is particularly an implant, e.g. a stent, vascular prosthesis, heart valve, joint etc., but may also be a component of an extracorporea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying an allosteric site in a target having two binding sites comprises reacting a compound with a reactive group at or near one and determining if this produces a change in the other site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     នន្តន្តន្តន្តន
                        CC transcribing respectively from at least two tissue RNAs are respectively (fragmented by using a same restriction enzyme; (b) each different adaptor and a common adaptor are added to each of the cDNA fragments derived from CC added cDNAs are mixed together; (d) an adaptor primer having the common Sequence to said different tadaptor and a gene-specific adaptor are used to amplify said adaptor-added cDNAs containing no region derived from CC polyadenylic acid of the mRNA before the addition of the adaptor among CC polyadenylic acid of the mRNA before the addition of the adaptor among CC the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the CDNA amounts are measured between the tissues; (f) the RNA is detected CC are added to each of the genomic DNA fragments derived from a same or CC different individuals; (h) the resultant adaptor-added genomic DNAs are mixed together; (i) the adaptor-added genomic DNAs are mixed together; (ii) the adaptor-added genomic DNAs are of the genomic DNAs are measured between the individuals. The method is cused for the detection of the amounts of RNA and DNA. The present componic to the different adaptor and DNA. The present of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent oticis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                  deoxyribonucleic acid; major groove; ethanoamino group; II-1; aziridinylcytosine; cross-linking group; o-xyloso linking group; human interleukin-1 beta; inverted polarity region; ss.

Residues 13 and 14 are linked via an oxyloso group (i.e. nucleotides that have xylose sugar linked via the oxylene ring). The sequence is designed to target the Human interleukin-1 beta gene beginning at nucleotide 7378 and will covalently cross-link to it via the

The synthetic oligomer is capable of forming a triplex at physiological CC pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human CC interleukin -1 beta gene beginning at nucleotide 7378 contg. a purine CC rich sequence concd. on one strand of the duplex. The oligomer, and CC others like it are useful in diagnosis and therapy of diseases CC characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, CC helices form under mild conditions thus assays may be carried out without CC subjecting the test specimen to harsh conditions. The oligomer contains CC an inverted polarity region formed from an o-xyloso dimer synthon. The CC linking gp. is o-xyloso (nucleotides have the 3' positions of xylose custons the diagram linked via the o-xylene ring). Two nucleotides are coupled through CC axylene residue to form the dimer synthon. The additional modifications CC may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also CC 118452452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAO75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of one or more human epidermal growth factor CC receptor (BGFR) genes (including HER1, HER2 HER3 and HER4) by RNA CC interference. The siNAs may or may not comprise ribonucleocides and may CC be double or single stranded. They further comprise sense and antisense CC regions, or alternatively are assembled from a sense oligonucleocide and CC an antisense oligonucleocide. Specifically, the siNAs include short CC interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short CC hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, CC can contain deoxyribonucleotides, and can be chamically synthesised, CC expressed from a vector or enzymatically synthesised. The invention also crelates to kits for the in vitro or: in vivo delivery of siNA; conjugates CC and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target CC identification, and gene mapping (e.g., of single nucleotide CC polymorphisms). The present sequence represents the lower strand of a CC HER2 (EGFR2)-targeted double-stranded siNA.
                                                                                                                   Query Match

cc regions, or alternatively are assembled from a sense oligonucleotide and can antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, come a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of EGR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or the treatment of a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target conjuncyhisms). The present sequence represents the upper strand of a contain HERZ (EGRZ)-targeted double-stranded siNA, which is identical to
